

Leave Management System - Project Documentation

Type: ServiceNow Scoped Application

Application Scope: `x_1958846_leave_0`

What This Project Is

The Leave Management System is a fully custom ServiceNow scoped application designed to replace manual, spreadsheet-driven leave tracking with a single, automated, self-service platform. It was built end-to-end from initial requirement gathering through backend automation, front-end portal delivery, security hardening, and production deployment following a structured five-phase enterprise implementation methodology.

At its core, the system solves a deceptively simple-sounding problem with real complexity underneath: an employee should be able to request leave in under a minute, have that request checked instantly against their real balance, routed automatically to the correct manager (without any hardcoded routing logic), and have their leave balance adjusted accurately the moment it's approved with zero manual intervention from HR at any step of that chain, and zero risk of the numbers ever drifting out of sync.

Documentation Index

Document	Overview	Brief Description
Phase 1 — Requirement Analysis and Planning	Objectives, scope, stakeholders, roadmap	Defines <i>why</i> the system exists, who it serves, and what "done" looks like — the foundation every later technical decision traces back to.

Document	Overview	Brief Description
<u>Phase 2 — Backend Development and Configurations</u>	Data model, business rules, automation	The engine room: the 3-table data model and the five Business Rules, Client Scripts, UI Policies, UI Actions, and Flow Designer automation that make the system self-enforcing.
<u>Phase 3 — UI/UX Development and Customization</u>	Self-service portal, confirmation page, dashboards	The employee- and manager-facing layer — the Service Portal experience most real users interact with, built on top of the Phase 2 engine without duplicating its logic.
<u>Phase 4 — Data Migration, Testing and Security</u>	QA testing, access control, data integrity	Where the system gets hardened for multi-user, real-data production use — roles, ACLs, structured test cases, and a real migration plan.
<u>Phase 5 — Deployment</u>	Deployment, documentation, demo planning	How the application moved from a development instance to a live, supported production system, plus the documentation and demo delivered to stakeholders.
<u>Project Conclusion</u>	Summary, outcomes, and future roadmap	Ties the whole project together — what was delivered, what was learned, and what a v2 would include.

Status at a Glance

System Snapshot

Metric	Value
Custom Tables	3 (Leave Request, Leave Bucket, Leave Calculator)
Business Rules	5
Client Scripts	3
UI Policies	2
UI Actions	2

Metric	Value
Flow Designer Flows	1 (manager-driven approval routing)
Custom Roles	3 (Employee, Manager, HR Admin)
Portal Pages/Widgets	4 (Request Form, Confirmation, Employee Dashboard, Manager Dashboard)

Notion Structure (Sub-pages)

Phase 1 - Requirement Analysis and Planning

Phase 2 - Backend Development and Configurations

Phase 3 - UI/UX Development and Customization

Phase 4 - Data Migration, Testing and Security

Phase 5 - Deployment
